EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

2. Authorization for this examiner's amendment was given in a telephone interview with James Duzan on 4/4/05.

3. The application has been amended as follows:

In The Claims:

In claim 4, delete "3" and insert therein - - 1 - -.

4. Claims 1, 2, 4, 6-13, 15, 17-23, 25, 27-33, 35, 37-45, 47, 49-51, 53, 55, 56 and 76-84 are allowed.

5. The following is an examiner's statement of reasons for allowance:

Regarding claims 1, 12, 23, 33, 45 and 51, the prior art of record fails to suggest the claimed methods, particularly the step of applying adhesive solely to a portion of the bumps or the front surface of a wafer.

Regarding claim 76, the prior art of record fails to suggest the claimed method of attaching a wafer having bumps on a surface thereof, particularly the step of attaching a tape having an adhesive and a backing on at least a portion of said surface having bumps thereon of said wafer, said tape contacting about 10% to about 60% of the surface area of said bumps.

Art Unit: 1733

As noted in Applicant's arguments filed on 7/16/04, Miyamoto et al teaches that the adhesive contacts the entire surface area of the bumps and the passivation film on the surface of the wafer, which prevents warpage of the wafer during thinning from the release of the internal stresses in passivation film. While Satoh does clearly teach having an adhesive tape wherein the adhesive only contacts 10% to 60% of the surface area of the bumps (See Figure 1C), there is no motivation to modify Miyamoto to have the adhesive only contact 10% to 60% of the surface area of the bumps because then the adhesive would not contact the passivation film and the wafer would warp.

It is also noted that while Satoh does clearly teach having an adhesive tape wherein the adhesive only contacts 10% to 60% of the surface area of the bumps (See Figure 1C), the thinning process of Satoh results in the formation of separate dies without the need to cut the wafer after the thinning step because grooves were formed in the wafer prior to thinning and the thinning step removed enough material to reach the grooves leaving separate dies. There is no motivation to modify the method of Satoh to thin the wafer and then cut the wafer into individual dies.

6. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
